Bidboard – Website Functionalities

Local account-backed auction marketplace built with React, Express, and SQLite.

1. Account management

- Create a new account with full name, email, and password.
- Sign in and stay authenticated with a remembered session or a session-only login.
- Sign out securely from the profile menu.
- Change the current password from account settings.
- Account records are stored in a local SQLite database instead of browser-only sample data.

2. Marketplace discovery

- Browse a live public auction feed from the Discover page.
- Search listings by title, seller, or category.
- Filter by category and maximum price.
- View a featured auction card with current bid and countdown timer.
- See active auctions in a catalog grid with bidding metadata.

3. Listing management

- Publish new auctions tied to the logged-in account.
- Set title, category, starting price, bid increment, duration, and optional image URL.
- Own listings stay attached to the seller account and appear in My Listings.
- Cancel only listings that have no bids yet.
- Sellers can see each listing with bid count and end time.

4. Bidding flow

- Place a valid bid only at or above the next increment threshold.
- The server rejects bids below the minimum allowed amount.
- The seller cannot bid on their own listing.
- Bid counts and current prices update immediately on successful bid placement.
- Bid history is visible in the auction details panel and account activity.

5. Watchlist and notifications

- Add or remove auctions from a personal watchlist.

- Track saved items in the Watchlist section.
- Receive notifications for successful bids and seller activity.
- Notifications are account-scoped and tied to the signed-in user.
- Notification counts appear in the header.

6. Account-private data

- Each user has separate bids, watchlist, listing history, and notifications.
- Other accounts can still see the public marketplace, but not other users' private account data.
- No real payment processing is included in this prototype.
- No email verification or transactional email is configured by default.

7. Demo / local prototype boundaries

- The app uses a local SQLite database and is intended for local demo/testing use.
- No real payment gateway, no production auth provider, and no real email service are configured.
- This is a functioning demo marketplace rather than a production e-commerce platform.

Capability summary

Capability	Status
Account registration	Yes
Sign in / sign out	Yes
Password change	Yes
Create listing	Yes
Bid on active listings	Yes
Watchlist	Yes
Notifications	Yes
Public marketplace feed	Yes
Private account data	Yes
Payments	No (demo only)
Real email delivery	No (demo only)

This PDF reflects the actual local marketplace features implemented in this project.
